

could be due to various reasons including the varietal unawareness, improper utilization of resources, lack of contact among farmers and extension agencies etc. (Joshi Gaurav., (2011) Therefore, the present study has been undertaken with the following objectives.

1.1 Objectives:

1. To analyze the resource use efficiency in tomato production.
2. To identify different marketing channels to estimate their efficiencies and to estimate the various constraints encountered in production and marketing of tomato.

2. Data and Methodology:

In the present study, resource use efficiency of tomato production, major marketing channels, marketing margin, price spread, marketing efficiency and the constraints encountered in production and marketing of tomato was estimated in Dharmapuri district of Tamil Nadu. Multistage sampling was employed in the study in selecting the sample respondents. 60 farmers and 10 marketing agencies (wholesalers and retailers and village traders) were randomly selected and interviewed using a pre-tested questionnaire in the study area.

2.1 Resource Use efficiency:

Production function analysis was used to assess the resource use efficiency in tomato production. The association between the dependent and independent variables, Cobb- Douglas production function (Pan *et al.*, 2011, Ramjilal *et al.*, 2017, Tambo *et al.*,2010) was designated for the study.

The regression is as follows,

$$Y = aX_1^{b_1}X_2^{b_2}X_3^{b_3}X_4^{b_4}X_5^{b_5}X_6^{b_6}\mu_t$$

Where,

Y = Tomato yield (Kg/ha)

X_1 = Quantity of seed material (g/ha)

X_2 = Quantity of Manures (Kg/ha)

X_3 = Quantity of fertilizers (Kg/ha)

X_4 = Plant protection chemicals (lit/ha)

X_5 = Human labour (man days/ha)

X_6 = Irrigation (Number of times/ha)

μ_t = Error term

a = intercept

$b_1 \dots b_6$ are the parameters to be estimated

2.2 Price spread and Marketing efficiency

The difference between the price paid by the consumer and that received by the producer of a particular commodity refers to the price spread. (shelke.,2009)

$$PS = RP - PNP$$

Where, PS = Price Spread

RP = Retailers Selling price

PNP = Producers Net Price

The marketing efficiency is ratio of the price received by the farmer to total marketing cost and margin. (Swaminathan et al., 2013)

a) Acharyas – Agarwal's approach

$$ME = \frac{FP}{(MC+MM)}$$

Where,

ME = Marketing efficiency expressed as percentage

FP = Price received by the farmer

MC = Total marketing cost

MM = Net marketing margin

b) Shepherds Market Efficiency Method :

The ratio of price paid by the consumer's (total value of goods) to total marketing cost (singh and Anuppam., 2010) is used as a measure of marketing efficiency.

$$ME = (V/I - 1)$$

Where,

ME = Marketing efficiency

V = Price paid by consumer

I = Total Marketing Cost

2.3 Response priority Index (RPI):

To estimate the production and marketing constraints encountered by the farmers and marketing agencies, constraints were ranked based on the preferences and ranked accordingly. The Response Priority Index (RPI) was obtained by combining the proportion of responses (PR) and the priority estimate (PE), where PR for the ith constraint is the ratio of the number of responses for that constraint to the overall number of responses, (Archana *et al.*, 2019; Navaneetham *et al.*, 2019) as defined by equation,

$$(RPI)_i =$$

$$\frac{\sum_{j=1}^k f_{ij} * [(k+1) - j]}{\sum_{i=1}^1 \sum_{j=1}^k f_{ij}}$$

Where,

(RPI)_i = Response priority index for ith constraint,

f_{ij} = Number of responses for the jth priority of the ith constraint (i= 1, 2,....., l;

j= 1,2,3....k),

K = Number of the priorities (1- Very high, 2-High. 3-Moderate, 4-Less and 5-

Very less),

X_{((k+1)-j)} = Scores for the jth priority,

$\sum_{j=1}^k f_{ij}$ = Total number of responses for the ith constraint,

$\sum_{i=1}^K \sum_{j=1}^K f_{ij}$ = Total number of responses to all the constraints.

Larger the RPI higher was the importance for that particular constraint.

3. Results and Discussion

The resource use efficiency determined by the Cobb Douglas Production Function is given below in the table 3.1

Table 3.1 Results of Resource use efficiency in tomato production in Dharmapuri district

S. No.	Variables	Coefficient	Std. Error	t-statistic	Prob.
1	Intercept	1.6592	1.4215	1.0467	0.3802

2	Quantity of seed material (g/ha)	-0.7324 ^{NS}	0.0428	-0.4324	0.6319
3	Quantity of Manures (Kg/ha)	0.0875 ^{NS}	0.0813	1.0761	0.2870
4	Quantity of fertilizers (Kg/ha)	0.1018 ^{**}	0.0388	2.7236	0.0125
5	Plant protection chemicals (lit/ha)	0.0696 ^{**}	0.0861	0.9083	0.0435
6	Human labour (man days/ha)	0.1392 ^{**}	0.0653	2.3206	0.0380
7	Irrigation (Number of times/ha)	-0.0271 ^{NS}	0.0342	-0.6276	0.5319
	R Square	0.8137			
	Adjusted R square	0.7326			
	F Statistic	27.4713			

**** Significant at 5% level and ^{NS} Not Significant.**

It can be determined from Table 3.1 that the coefficients of multiple determination (R^2) was 0.8137 indicating that 81 per cent of the systematic variation in tomato yield could be attributed to the independent variables included in the model. In a Cobb Douglas Production Function, the coefficients denote the production elasticities of the resources used in the model. The coefficients including plant protection chemicals, human labour and fertilizers were positively influenced the yield of tomato at 5 per cent level of significance.

The results revealed that one per cent increase in quantity of plant protection chemical, human labour *Ceteris Paribus* would increase the yield of Tomato by 0.069 and 0.139 per cent respectively at the existing geo-mean level. The coefficient of the variable fertilizers were found to be significant at 5 per cent level, indicating that one per cent increase in the irrigation *Ceteris Paribus* would increase the yield of tomato by 0.101 per cent at existing geo-mean level. The variables including quantity of seed material, quantity of Manures, irrigation were found to be non-significant.

3.2 Marketing channels and Margins of Tomato in Dharmapuri district of Tamil Nadu

A marketing channel is a pathway through which a produce travel from the producer to the final consumer through middlemen. Price spread of different marketing channels were calculated and analysed to determine the channel which is more efficient in marketing of Tomato in the Dharmapuri district of Tamil Nadu. (Akter *et al.*, 2017)

Predominant marketing channels were identified in the study district and it could be inferred that major marketing channels in marketing Tomato include,

1. Producer – Consumer (Direct marketing channel)
2. Producer – Retailer – Consumer
3. Producer – Wholesaler– Retailer – Consumer
4. Producer – Village Trader – Retailer – Consumer

Table 3.2 Marketing channels and Margins of Tomato**(Rs. /Quintal)**

S.No.	Particulars	price			
		Channel-I	Channel-II	Channel-III	Channel-IV
A	Producer				
1	Producer price	1802.00	1691.00	1511.00	1505.00
2	Packaging	200.00	100.00	90.00	80.00
3	Loading/ Unloading	10.00	9.00	10.00	6.00
4	Transportation	28.00	30.00	34.00	22.00
5	Loss	160	120.00	155.00	100.00
6	Total Marketing Cost	398.00	259.00	289.00	208.00
7	Net price	1702.00	1432.00	1222.00	1297.00
B	Wholesaler				
1	Purchase Price	0.00	0.00	1511.00	0.00
2	Packaging	0.00	0.00	110.00	0.00
3	Loading/unloading	0.00	0.00	10.00	0.00
4	Transportation	0.00	0.00	35.00	0.00
5	Loss	0.00	0.00	90.00	0.00
6	Marketing cost	0.00	0.00	245.00	0.00
7	Sale price	0.00	0.00	1705.00	0.00
8	Marketing margin	0.00	0.00	194	0.00
C	Village trader				
1	Purchase Price	0.00	0.00	0.00	1505.00
2	Packaging	0.00	0.00	0.00	85.00
3	Loading/unloading	0.00	0.00	0.00	20.00

4	Transportation	0.00	0.00	0.00	40.00
5	Loss	0.00	0.00	0.00	100.00
6	Marketing cost	0.00	0.00	0.00	245.00
7	Sale price	0.00	0.00	0.00	1735.00
8	Marketing margin	0.00	0.00	0.00	230.00
D	Retailer				
1	Retailer Purchase Price	0	1691.00	1705.00	1735.00
2	Packaging	0	0.00	0.00	0.00
3	Loading/unloading	0	12.00	12.00	14.00
4	Transportation	0	19.00	45.00	50.00
5	Loss	0	120.00	150.00	160.00
6	Marketing cost	0	151.00	207.00	224.00
7	Sale price	0	2100.00	2107.00	2000.00
8	Marketing margin	0	309.00	402.00	265.00
E	Consumer				
1	Purchase price	1802.00	2100.00	2107.00	2000.00

(source : Primary survey)

From Table 3.2, it could be inferred that of the listed marketing channels, Channel-III had highest marketing cost of Rs. 741/ Quintal, followed by Channel-III of RS. 677/quintal and Channel-II of Rs.410/ Quintal respectively. Channel-I is the direct

marketing channel. It is also revealed that channel-III had a highest marketing margin of Rs.596/quintal followed by channel-IV and channel-II of Rs.495/quintal and Rs.409/quintal respectively by the market intermediaries.

Table 3.3. Price spread in marketing efficiency of Tomato (Rs./qtl)

S.No	Particulars	Price			
		Channel-I	Channel-II	Channel-III	Channel-IV
1	Net price received by the producer	1802.00	1691	1511	1505
2	Total Marketing cost incurred by producer, wholesaler, retailer, village trader	398.00	410	741	677
3	Total market margin of	0.00	309	596	495

	wholesaler and retailer				
4	Selling price of retailer/ purchase price of consumer	1802.00	2100	2107	2000
5	Price spread	0.00	409.00	596.00	495.00
6	Marketing efficiency (Acharyas and Agarwals)	4.52	2.40	0.86	1.28
7	Marketing efficiency (Shepherds)	4.52	3.37	1.84	1.95

From table 3.3, it could be inferred that of the listed marketing channels, Channel III had higher price spread of Rs. 596/ Quintal, followed by Channel IV and Channel II with the Price spread of Rs.495/ Quintal and Rs. 409/ Quintal respectively. Channel I is the direct marketing channel and it was observed to have no price spread. It also revealed that the marketing efficiency was higher in channel-I of 4.52 by both Acharya and shepherds marketing efficiency method followed by channel-II, channel-IV and channel-III for the Tomato crop. From the result it was concluded channel I resulted in high efficiency and channel-IV resulted in the poor efficiency of marketing of Tomato.

3.3. Varietal Preference of marketing agencies:

Sago is the most preferred variety in Dharmapuri district as 60 per cent of the tomato growers go for this variety. It is favoured over Madhan and Kalyan due to ns, Transportation and storage, Market speculation etc. (Kalidas and Akila., 2014)

Figure 2: Seasonal index of Tomato

the various reasons like The fruits are spherical, Dark red when fully ripe and exhibit consistent ripening, excellent firmness, and can be stored effectively once ripened. It is best suited for transport and storage capabilities, outperforming other round-fruited varieties by maintaining quality for 8-10 days at room temperature.

3.4 Seasonal Index:

The seasonal index, which represents the relative price fluctuation compared to the average price over the entire year, indicates that the prices of tomatoes were at their lowest during March and February, and highest during May, June, July, November, and December.

The seasonal fluctuations in tomato prices can be attributed to various factors, including seasonal harvesting, Interstate arrivals, Demand – supply imbalance, Weather conditio

Figure 1: Monthly variations in the prices of tomato from January 2019 to May 2023

Source: (<http://www.indiastat.com> 2023)

Table 3.4 Production Constraints

S.No.	Constraints	Index value	Rank
1	Scarcity and high cost of labor	0.75	1
2	Lack of access to institutional credit by farmers	0.68	4
3	Small size of Landholdings by farmers	0.51	6
4	Poor availability of inputs	0.45	7
5	High incidence of pest and diseases	0.72	2

6	Higher Cost of inputs and fewer subsidy	0.70	3
7	Technological Illiteracy	0.54	5

If the value is greater than 100, then the price was greater than the average. This would usually happen in the month of July, November, December because of less arrivals of tomato from Andhra Pradesh and Karnataka market to Tamil Nadu market. In June 2023 the price has gone up to Rs. 12000/ quintal.

3.5 Constraints encountered by farmers and Marketing agencies

All the farmers were interviewed for the problems they are facing while producing and marketing of vegetables. The information regarding the important problems faced by the growers is presented in Table 3.3.

From Table 3.3, it could be inferred that the major production constraint countered were

high cost of labor with RPI score of 0.75. The second and third major constraints include high incidence of pest and diseases and higher cost of inputs and fewer subsidies with RPI Score of 0.72 and 0.70 respectively.

3.5.2 Marketing Constraints

The marketing constraints encountered by the marketing agencies were given in the table 3.4

From Table 3.4, it could be inferred that the major marketing constraints encountered include frequent price fluctuation of vegetables with RPI score of 0.73. The second and third major constraints include lack of transportation facility and lack of cold storage facilities for vegetables with RPI Score of 0.70 and 0.69 respectively.

Table 3.5 Marketing Constraints

S.No.	Constraints	Index value	Rank
1	Lack of cold storage facilities for vegetables	0.69	3
2	Improper dissemination of market information	0.65	4
3	Unorganized marketing system	0.52	7
4	Higher storage cost	0.48	8

5	Frequent price fluctuation of vegetables	0.73	1
6	Lack of transportation facility	0.70	2
7	Low Profit from sale of vegetables	0.60	5
8	Heavy losses in market	0.55	6

4. Summary and Conclusions

The study made an attempt to estimate the efficiency of resource use in tomato crop and to estimate the major marketing channels and the production and marketing constraints of Tomato in Dharmapuri district of Tamil Nadu. The results of the Cobb Douglas production function in estimating the resource use efficiency, revealed a positive significant relationship of the variables including quantity of fertilizer (Kg. /ha), plant protection chemicals (lit/ha) and human labour (man days/ha) applied to the Yield of Tomato (Kg/ha). Direct marketing channel was observed to be the efficient marketing channel and had highest marketing efficiency because of its significant lower price spread, whereas the Channel III (Producer – Wholesaler– Retailer – Consumer) was observed to be the inefficient marketing channel and had poor marketing efficiency of tomato because of the highest price spread of the channel with Rs. 596/Quintal and the involvement of large number of intermediaries. The major production constraints encountered farmers and marketing agencies include high cost of labor, high incidence of pest and diseases, and higher cost of inputs and fewer

subsidies. The major marketing constraints encountered by farmers and marketing agencies include frequent price fluctuation of vegetables, lack of transportation facility and lack of cold storage facilities for vegetables.
