

to other types of industries and components. The results of such approaches are dependent upon experts' conceptual opinions. This is considered as other limitation for the proposed model. For this reason, it is so important that experts who make the comparisons be familiar with the sustainable criteria and ELV strategies. Sustainable ELV collection in the reverse supply chain can be the future research direction for researchers. Also, the results of this study could be compared with that of other fuzzy multi-criteria techniques such as fuzzy ELECTRE, fuzzy PROMETHEE, or fuzzy VIKOR.
